

Control Panel

System and Security

Firewall

- Use recommended settings
- If it won't turn on, check services

Security and Maintenance (Action Center)

- UAC
  - Slider bar all the way up
- Smartscreen (in a different spot in newer builds of Windows)
  - Turn on to max setting
- Will tell you other basic problems with your machine
  - Ex. windows defender is turned off

What is UAC?

- User Account Control
- A feature in Windows
- UAC provides a heightened awareness to security issues
- A UAC message appears anytime something occurs that normally would require an administrator-level decision to make changes to the system
- This is to protect users from themselves as well as software that is trying to change the system. Even if a person is logged in with an Administrator account, the UAC prompt appears to confirm the action that is about to be performed

System

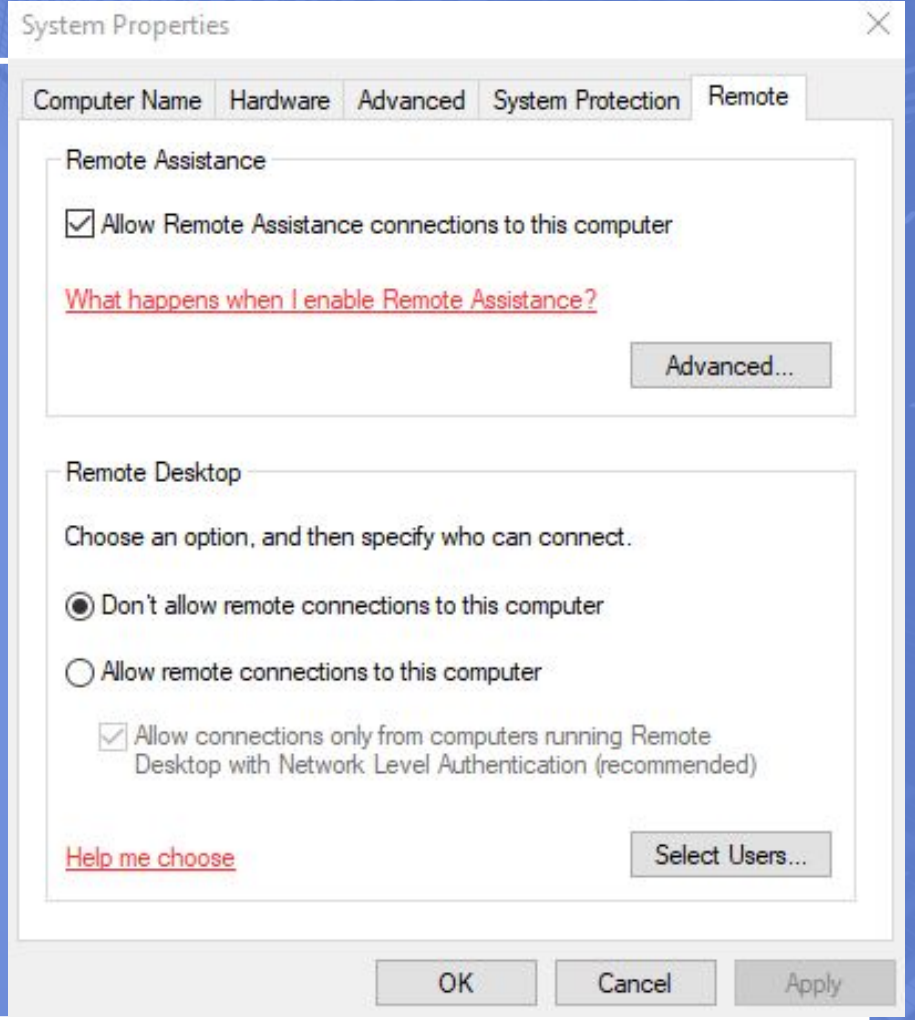

- Remote settings
  - Turn off remote assistance and remote desktop unless otherwise specified

You can also access the remote settings with Win+Pause|Break or use sysdm.cpl

Remoting

Remote Assistance vs Remote Desktop -

Take a guess!

Remote Assistance vs Remote Desktop

Remote Assistance displays a prompt at the remote computer asking permission to allow the computer to be viewed remotely, and Remote Desktop does not display this prompt.

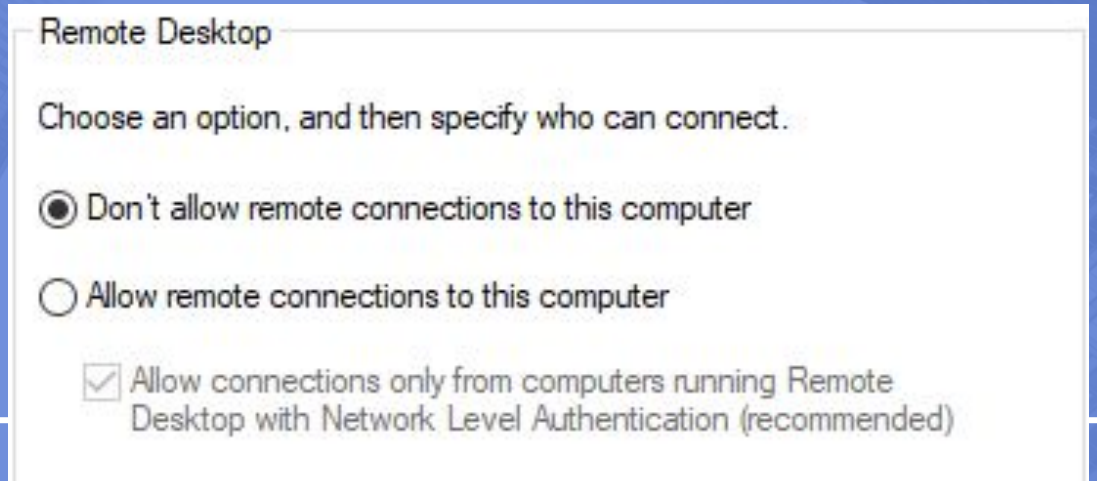

Assistance is meant for viewing/assisting someone, remote desktop is meant for controlling a computer, typically for administrative purposes.

Remote Settings

For a typical home computer, you will not need either of these, so the recommended setting is to have these off.

Remote Desktop with Network Level Authentication

Checking the box will require the connecting user to authenticate themselves before a session is established with the server

Programs and Features (appwiz.cpl)

Programs

- Uninstall unauthorized programs not stated in the readme
  - **DO NOT UNINSTALL CRITICAL PROGRAMS**
    - Ex. **THE SCORING ENGINE**
    - Ex. **MICROSOFT VISUAL C++ Redistributables**
    - Ex. **NET FRAMEWORK**

32 vs 64 bit debriefing

32 bit

- More common with old programs
- Max handling of 4 GB

64 bit

- More powerful than 32 bit
- Can handle more data at once

Installation Locations

Folder	Description
System32	64-bit Windows system files
SysWOW64	32-bit Windows system files
Program Files	64-bit application files
Program Files (x86)	32-bit application files

Why different folders?

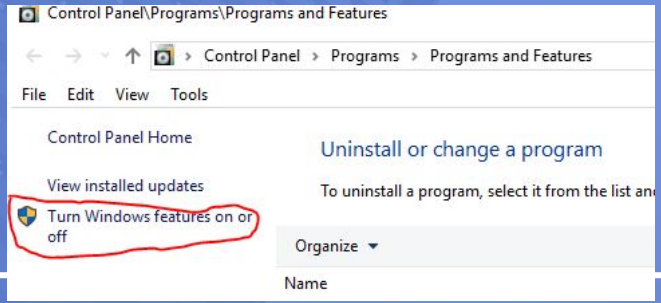

Windows has **DLL files** which are shared resources used by many applications

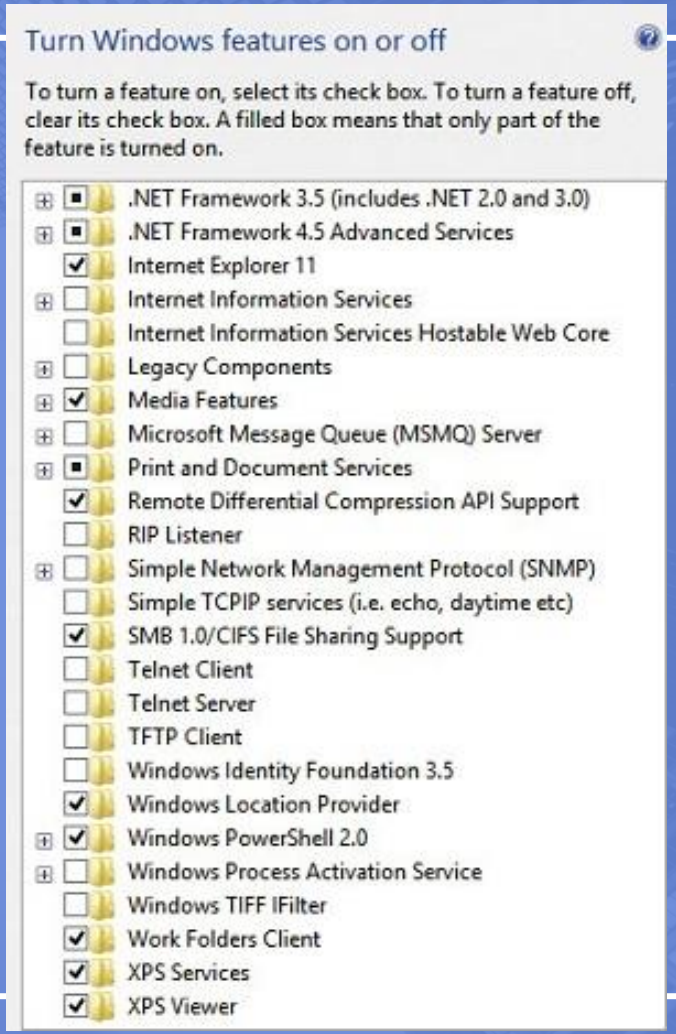

A 32-bit application cannot work with 64-bit version DLL

Windows will know the proper DLL to use for programs

Features

- Anything remote (if remote is not needed)
- Telnet
- RIP Listener

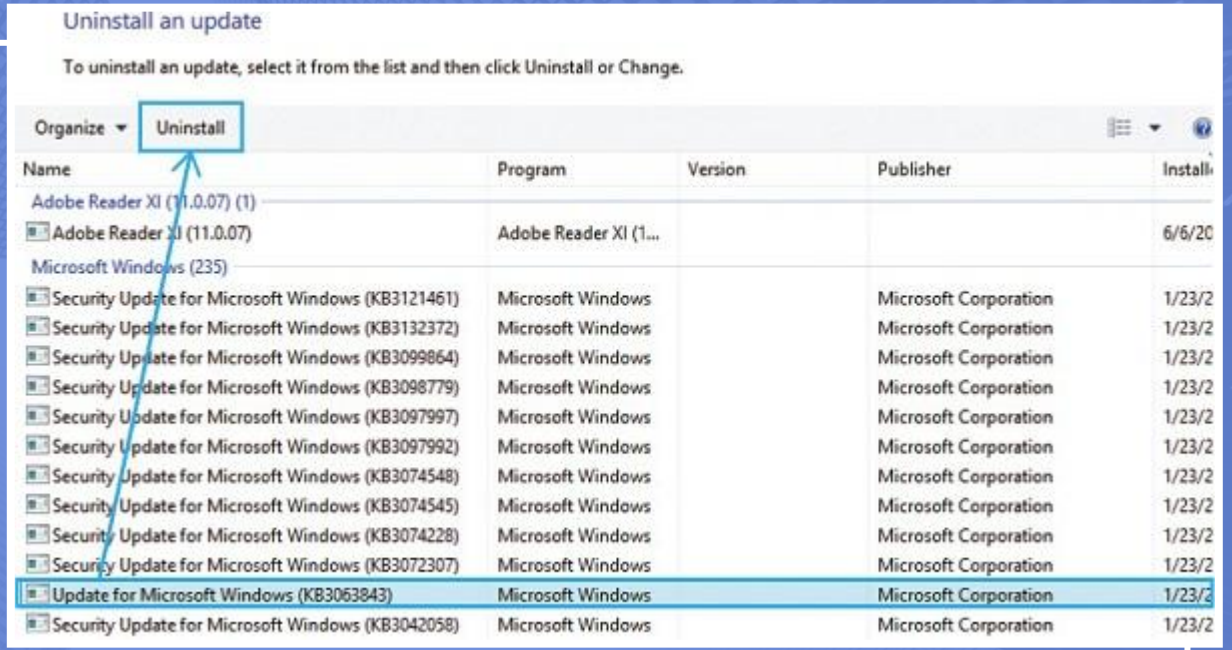

Updates

You can uninstall updates if you desire

Only really used to uninstall alpha/beta updates or bad patches

Hardware and Sound

Autoplay

- Disable
- It's bad. Anyone know why?
- Uncheck the box on top of the page
- Box should not be checked
- Should not be on

Appearance and Personalization

File Explorer Options

- Hidden Files
  - View tab
    - Show hidden files and folders
    - Uncheck “hide protected operating system files”
