Group Policy

GPEDIT and LGPO

ur mum

Review: What is Group Policy

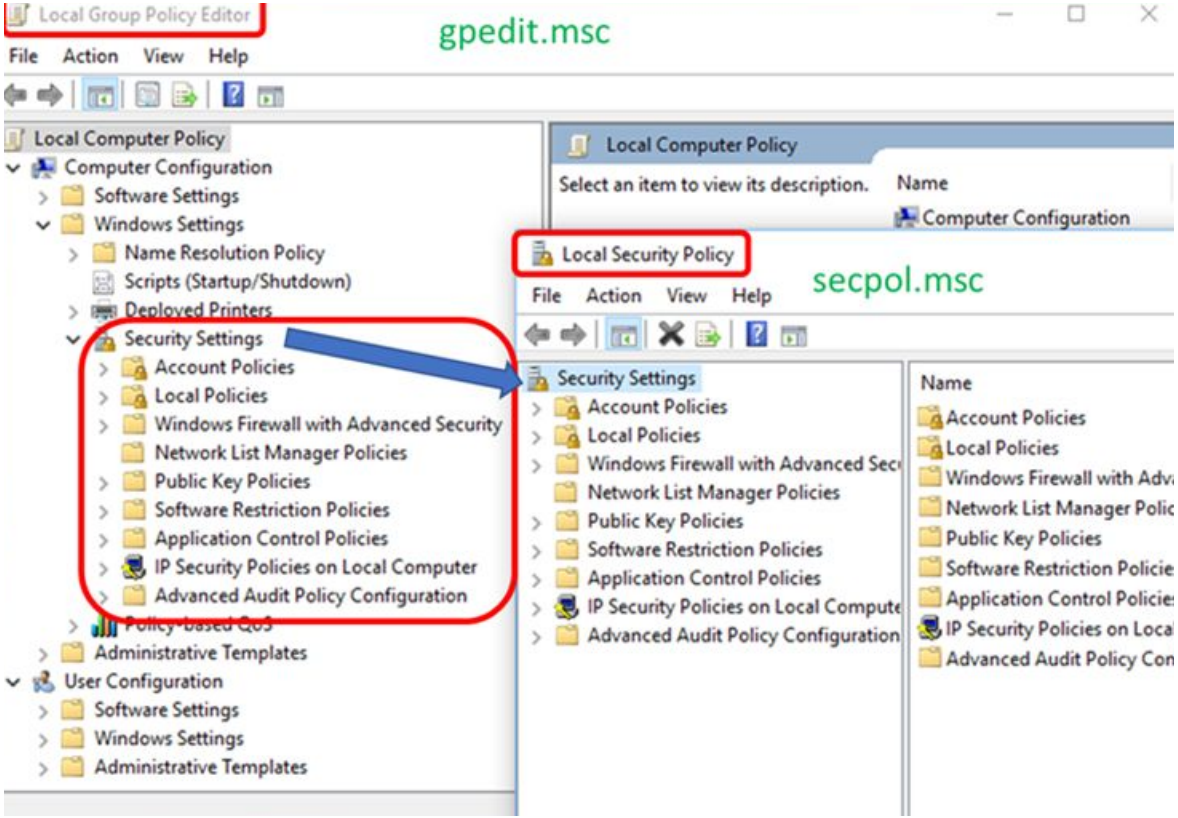

- Group Policy is the set of rules that govern your computer
- The Group Policy is able to:
  - prevent users from changing settings
  - change appearance of the computer
  - govern what connections computer makes
- There is a tonne of settings
  - about ~4000 depending on version of Windows (Pro vs Education etc) and what programs are installed
  - Most are not security related, and the ones that are can be figured out with common sense

Group Policy Editor

The Group Policy Editor is the built in tool for Windows to manage your computer's policies

Win+R: gpedit.msc

You'll note that LSP is a part of the overall Group Policy

Sample Configurations

- Computer Configuration > Administrative Templates > Windows Components > Autoplay Policies
  - "Turn off Autoplay" - Enabled for All Drives
- Computer Configuration > Administrative Templates > Windows Components > Remote Desktop Services > Remote Desktop Session Host > Connections
  - "Allow users to connect remotely by using Remote Desktop Services" - Disabled
- Computer Configuration > Administrative Templates > Windows Components > Search
  - "Allow Cortana" - Disabled

More Sample Configurations

- User Configuration > Administrative Templates > Control Panel > Personalization
  - "Enable screen saver" - Enabled
- Computer Configuration > Administrative Templates > Network > Network Connections > Windows Firewall
  - For all profiles, set "Windows Firewall: Protect all network connections" to Enabled
- Computer Configuration > Administrative Templates > Windows Components > Remote Desktop Services > Remote Desktop Session Host > Security
  - "Require secure RPC communication" - Enabled
  - "Require user authentication for remote connections by using Network Level Authentication" - Enabled

Woah wait that's too much

But it's okay, because you can research the different group policies on your own!

- https://www.stigviewer.com/
- https://gpsearch.azurewebsites.net/
- Or Google "gpedit hardening forum"

LGPO

What is LGPO

- Stands for Local Group Policy Object
  - a tool for importing and exporting group policy settings.
- Download LGPO here: https://www.microsoft.com/en-us/download/details.aspx?id=55319
  - Drag LGPO.exe to your C:/Windows/System32/ folder
  - Now you are ready to use lgpo and you can use the lgpo cmd command

MAKING A BACKUP:

Once you have configured all your GPO stuff, and you are ready to export, follow these instructions:

1. Open cmd with admin privileges
2. Type: LGPO /b <path where u want to save the policy>
3. Example: LGPO /b “%USERPROFILE%\Desktop”
4. This will make the backup folder on your current user’s desktop
5. Now you have a file with many letters and numbers (looks like {DR662F-Q3… etc)
6. Rename to whatever you want

Voila

APPLYING YOUR BACKUP:

Download your LGPO folder to your VM

1. Drag your backup folder to your desktop (or wherever you want)
2. Open cmd with admin privileges
3. Type: LGPO /g <path of the folder with the name>
4. Example: LGPO /g “%USERPROFILE%\Desktop\Windows10Policies”
5. This will apply the settings from the backup you made called Windows10Policies on your desktop
6. Finally, type: gpupdate /force

Ur done

thx

If you have any questions about using LGPO, ask one of the instructors in class.

Your friendly neighborhood instructor should share this powerpoint or other resources because this is important stuff
