Perfectly working PC

ACTUALLY INSTALL UPDATES
TAKES 1 HOUR TO UPDATE
UNDOING CHANGES
BSOD :)

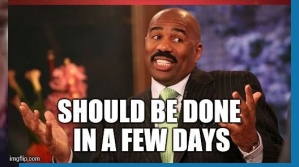

YOU WANT TO LOG AND GET SOME WORK DONE?
Applying update operation 201 of 8375 (XpsPrint.dll)

LET ME SING YOU THE SONG OF MY PEOPLE.

SHOULD BE DONE IN A FEW DAYS

ohno

It's taking a bit longer than usual, but it should not be ready soon
Don't turn off your PC

Windows ULTIMATE

EVERY UPDATE IS HERE

Other similarities

- They are both Windows
- Both made by Microsoft
- Please use Linux instead
- Or use the Cisco Packet Tracer Desktop
  - Has a web browser that doesn't ban you from google
  - Comes with a nice clean desktop
  - Doesn't have update
- Or anything instead
- Except solaris
  - Anything but solaris

not this tracer

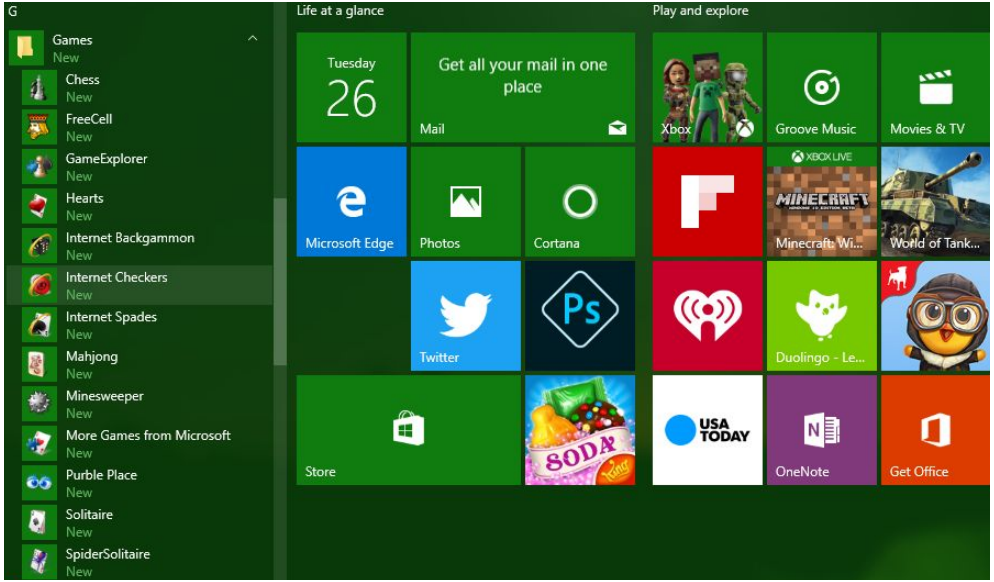

Differences

Graphical representation of Windows version numbers

In all honesty

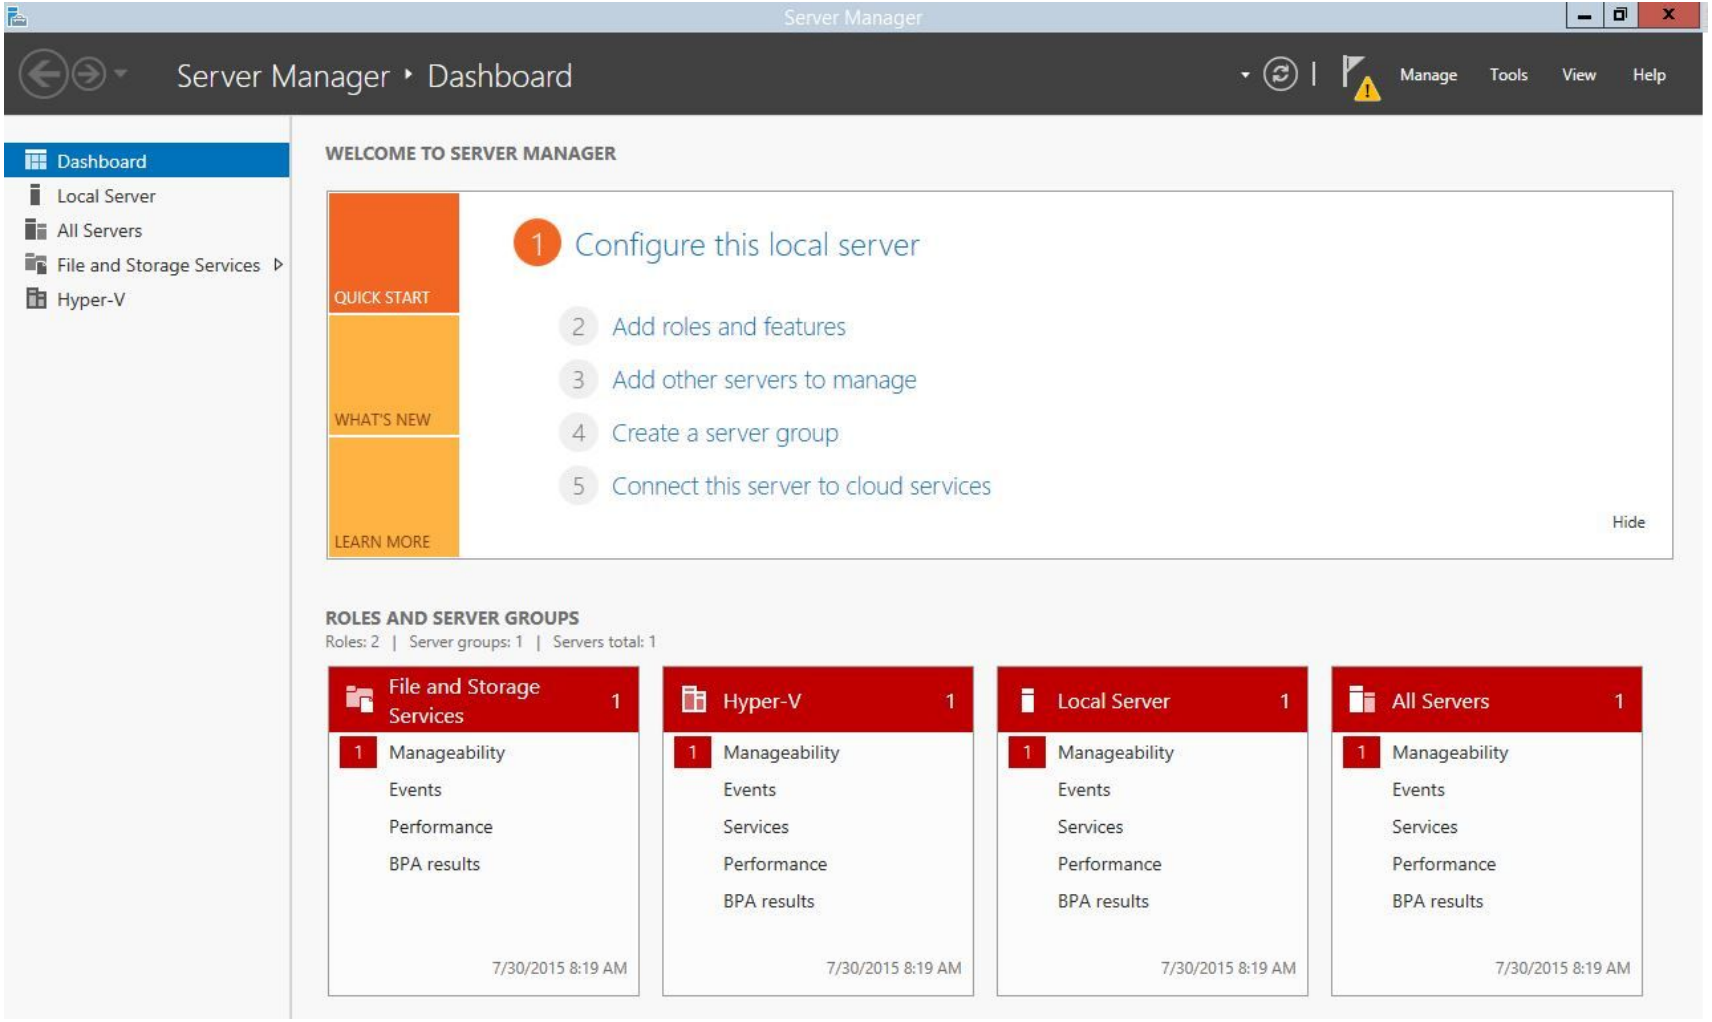

2016/19 is literally Windows 10 but

- Stripped of its random stuff like
  - candy crush s o d a
  - windows store
  - cortana
  - edge
- Some extra stuff
  - Server Manager (new interface for adding/removing roles)
  - More roles and features

As the name suggests, 2016/2019 is server, 10 is client

Good idea to use powershell for server

Role Management

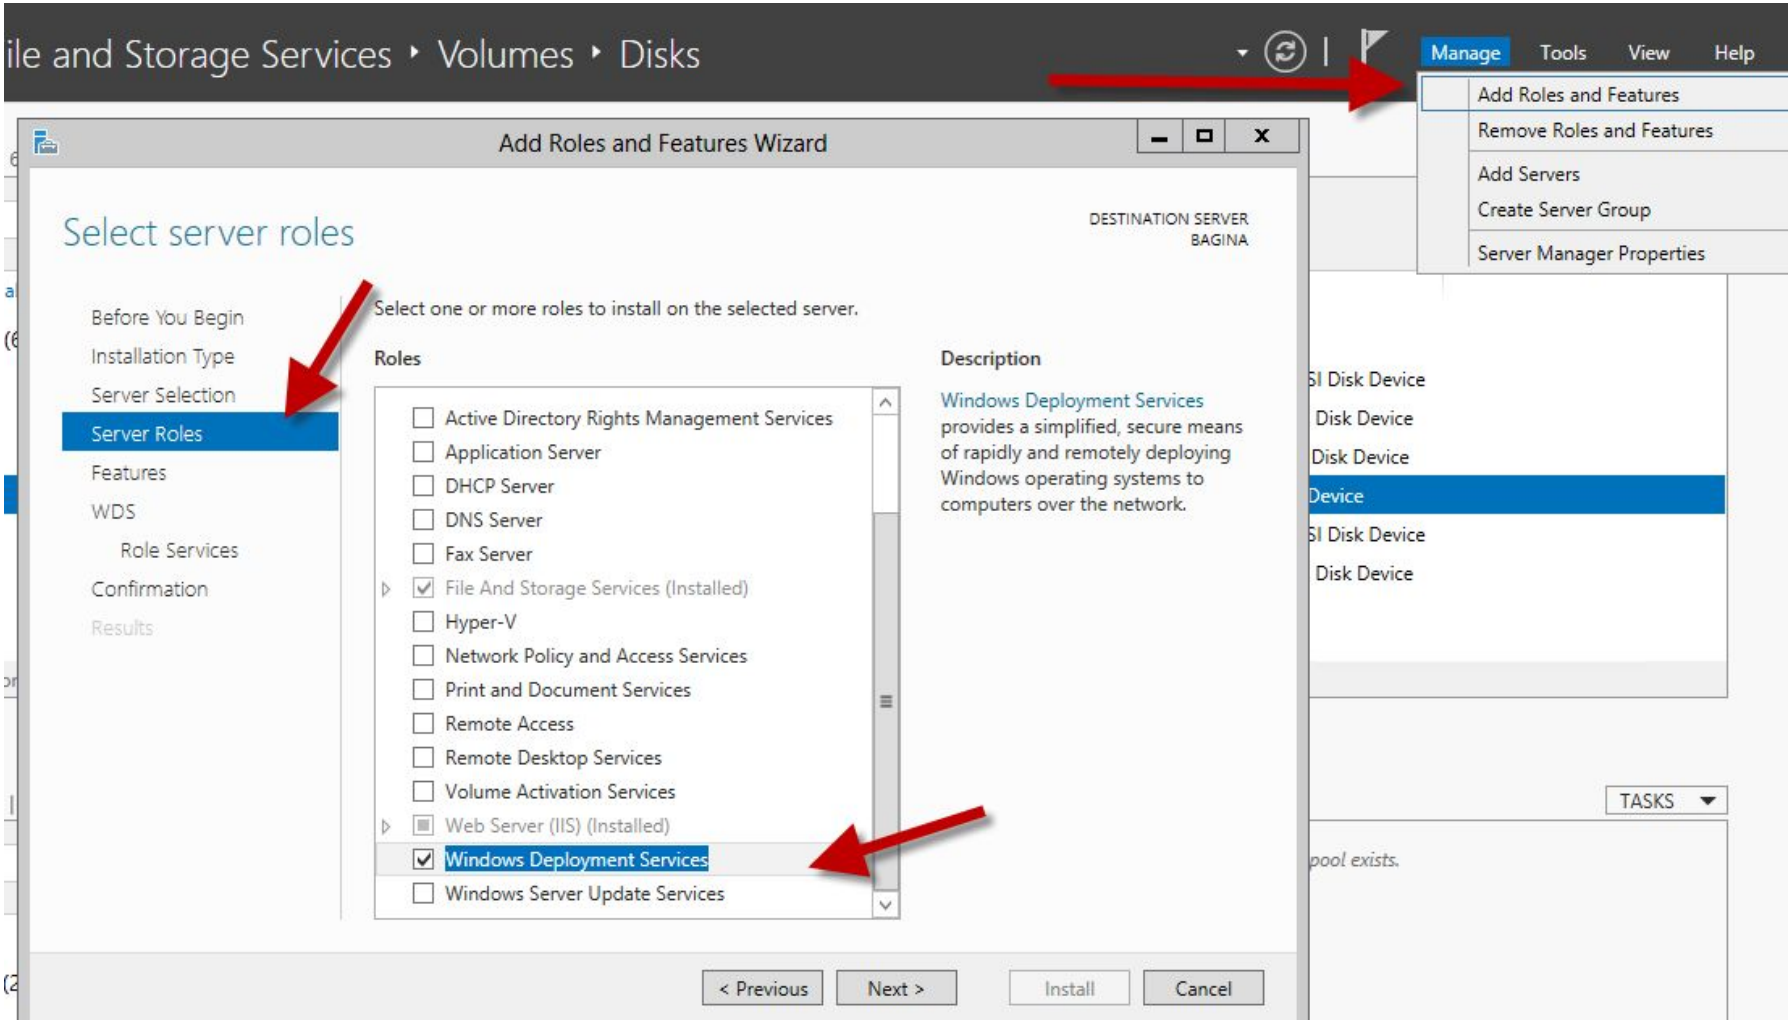

Role management is a tad bit fancier

Process

- Select role-based or feature-based installation
- Select computer you would like to manage (your own)
- Choose the role you want added/removed

There are two different windows for adding and removing roles/features - you cannot add and remove roles and features in one go

First two steps of the process outlined above are automatically set for you, so you just need to click the Next button

wait a sec, i gotta pay 700% more ($700+) for server?

yes, and 10 and 2016 are quite similar

and no there’s not much performance difference

that’s why Linux is more common for servers

the sad life of Windows

that’s literally it

home users have no reason to use the roles and features of servers
windows 10, windows 2016, and windows 2019 share the same kernel

windows 10 is windows 2016 but some restricted features

- ex: cannot join a domain
- ex: cannot be a DNS server
- ex: cannot use the virtualization role
- ex: no IE ESC

2016 vs 2019

2016 is one of the fastest ever server versions - 2019 is meant as a continuation of that

Server 2019

- heavily based on 2016
- new changes in server hybridization, security, new application platform, new features
  - ex: includes Advanced Threat Protection (ATP) in Windows Defender
  - ex: extra Azure AD capabilities
    - Azure is just cloud-based

There aren’t that many differences

Most features are for advanced scenarios that would be difficult to implement with a localized virtual server (the server has no clients to connect)

Main concerns between 10 and server are the roles/features and IE ESC
Main differences between 2016 and 2019 is Windows Defender ATP

For a full list check out microsoft’s documents
“What’s New in Windows Server”
they have documentation on 2016 and 2019 new features

At least they aren't Windows 8

The Windows Store is one of the largest buttons here
