5.1-5.4 Advanced Security

Miscellaneous Security Settings

Only for the cool advanced kids

brought to you by clem, ceo of subway

Run: “control system” or Win+Pause|Break

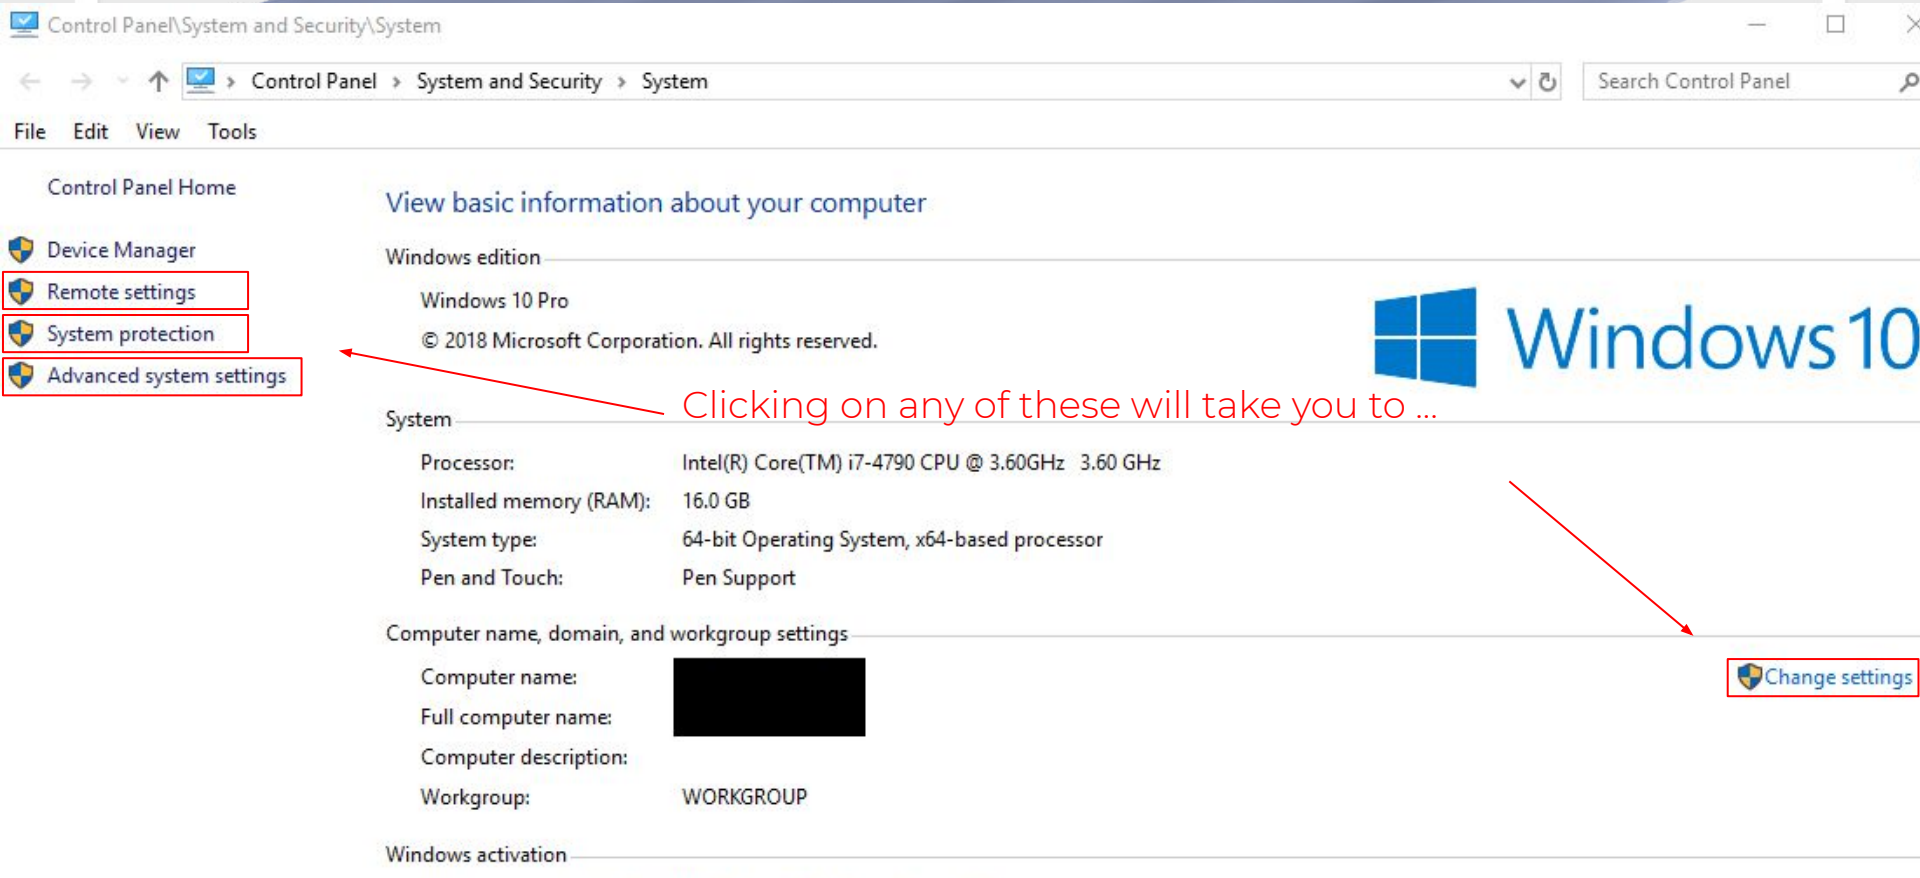

System info

- Edition
- Processor
- RAM

Network info

- Computer name
- Domain/workgroup

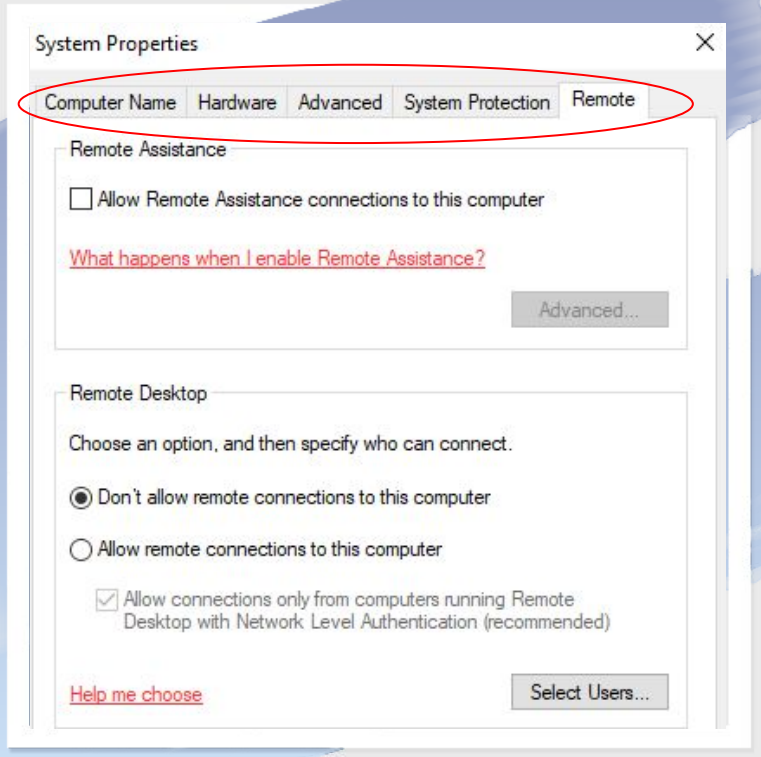

SYSTEM

Workgroup: WORKGROUP
Change settings
Windows activation

5.1 System Properties

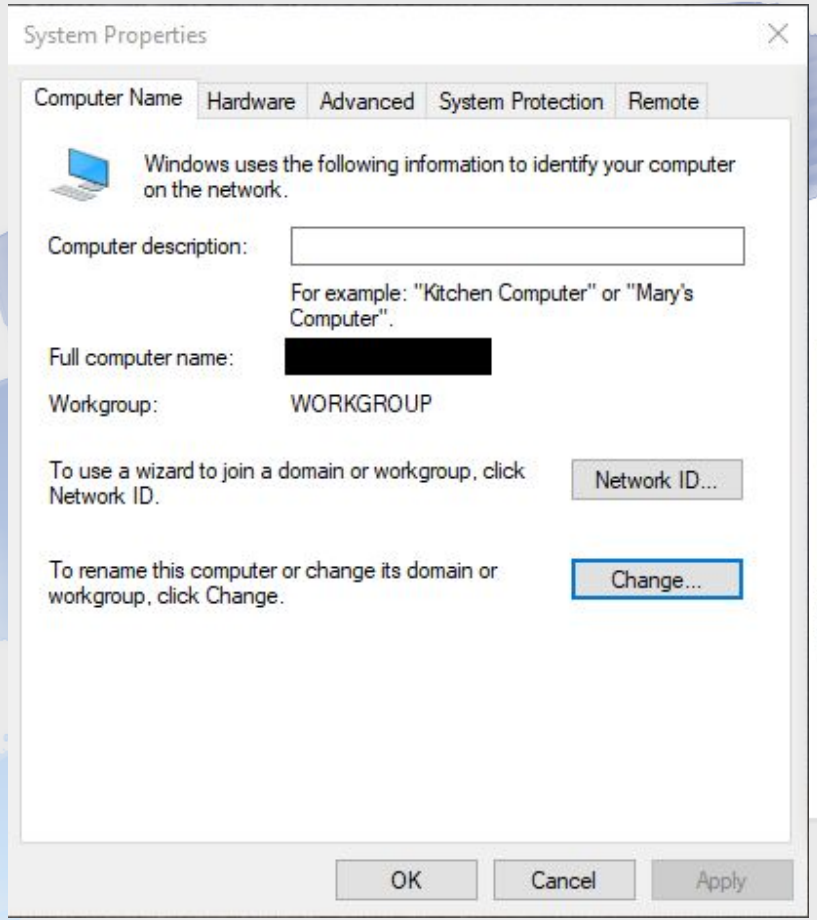

System Properties

There are more tabs than “Remote”

Computer Name

- Change description
- Change network ID
  - Joining workgroup/domain
- Change computer name/domain

Computer Groups

- **Homegroup** - network of computers in a home
- **Workgroup** - network of computers in a workplace
- **Domain** - network of computers in a corporation

Homegroups and workgroups are decentralized

No central computer handling all the users and computers etc

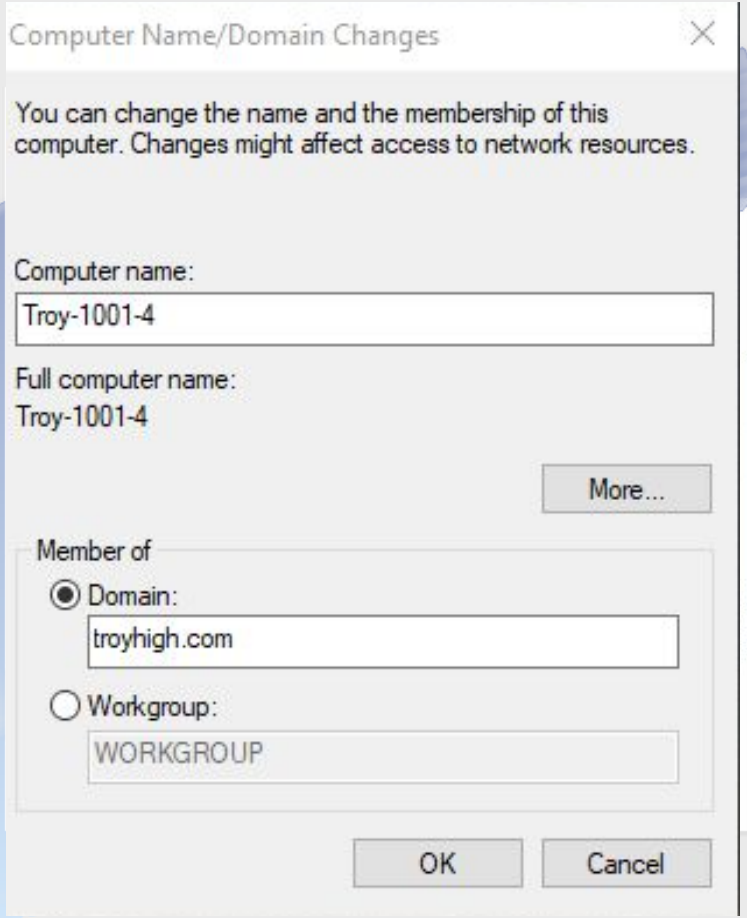

Why Rename?

Organization

Instead of “Please fix DESKTOP-DNM5QRM”

“Please fix Troy-1001-4”

- as in “the 4th computer in room 1001 at Troy”

Why Rename? (cont.)

Quick access in a private network

WIN-5LATHCLO73A.contoso.com

vs

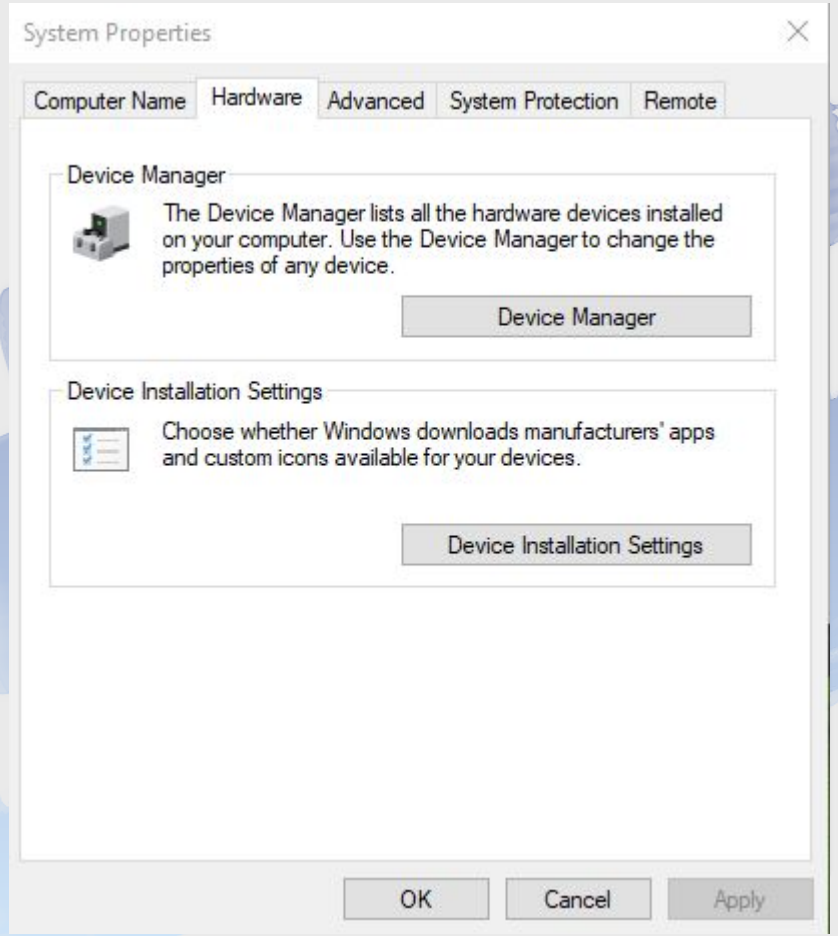

mail.contoso.com

DNS does make this easier without needing to rename your computers, however (will talk about later)

Hardware

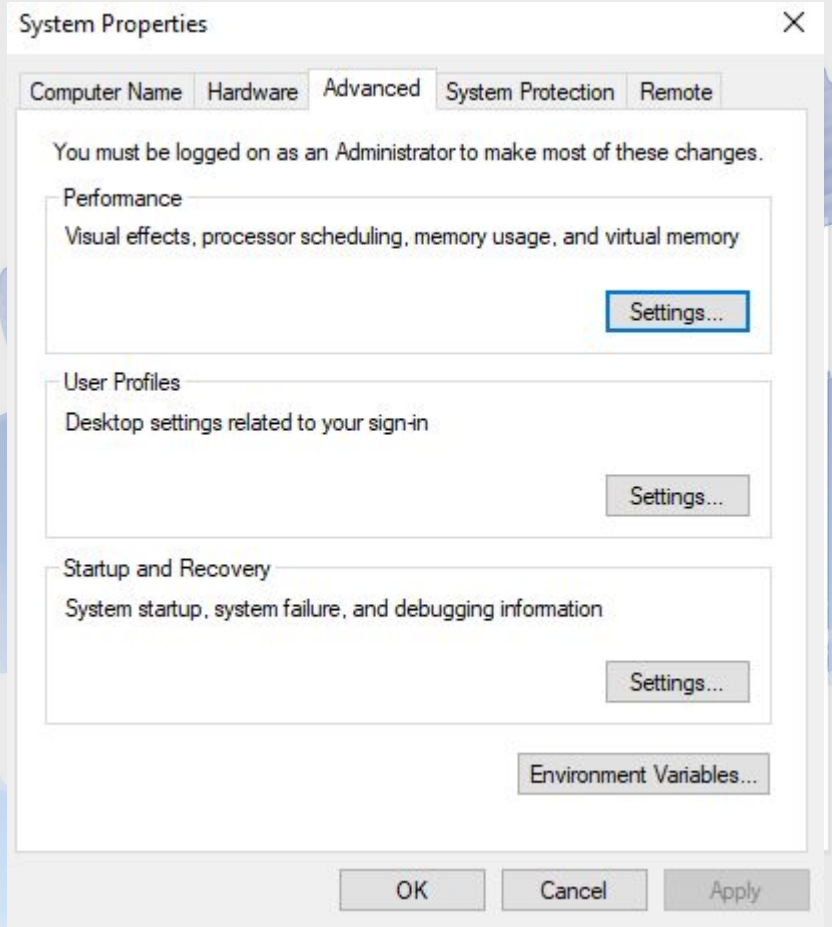

- Access the device manager
- Change settings for driver updates

More for tech support than security

Advanced

- Change performance
- Handle user profiles
- Startup settings
- Environment variables (useful for commands and others)

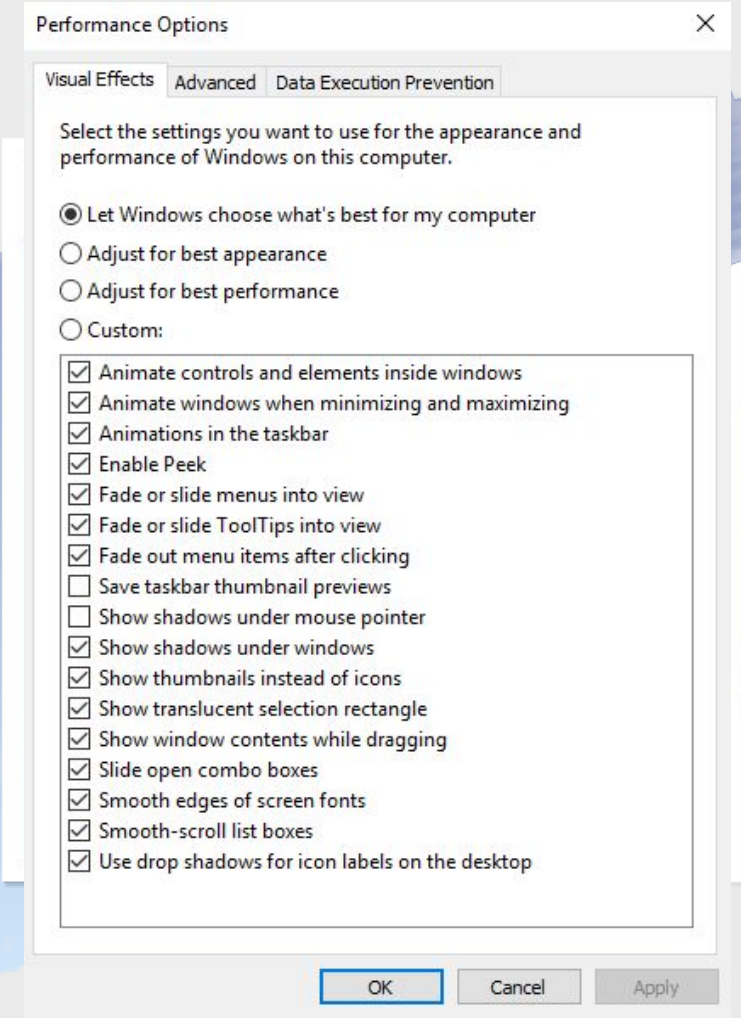

Performance Options

Make your VM go “i am speed”

Adjust for best performance if you wish

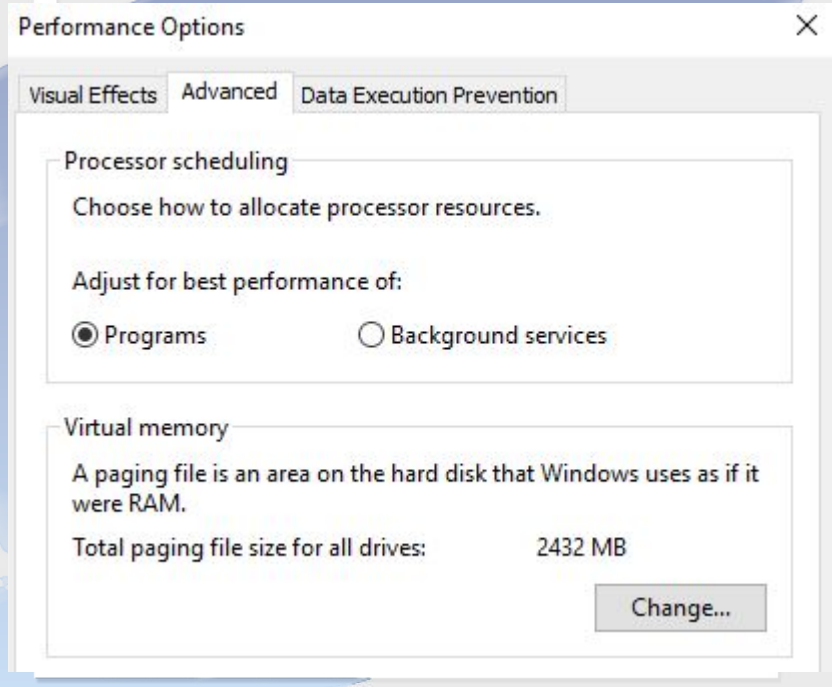

kerchoo

Perf - Adv

Remember LSP's "Clear virtual memory at shutdown"?

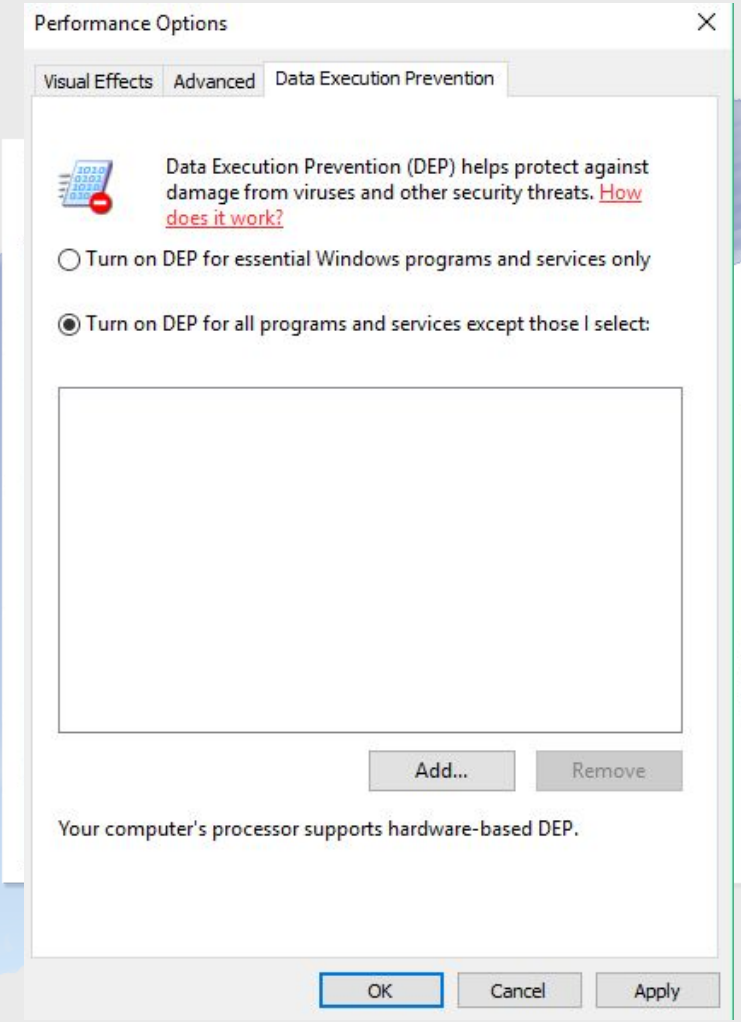

Here it is again

DEP

Performs additional checks on memory to prevent malicious code from running

Should turn on for ALL

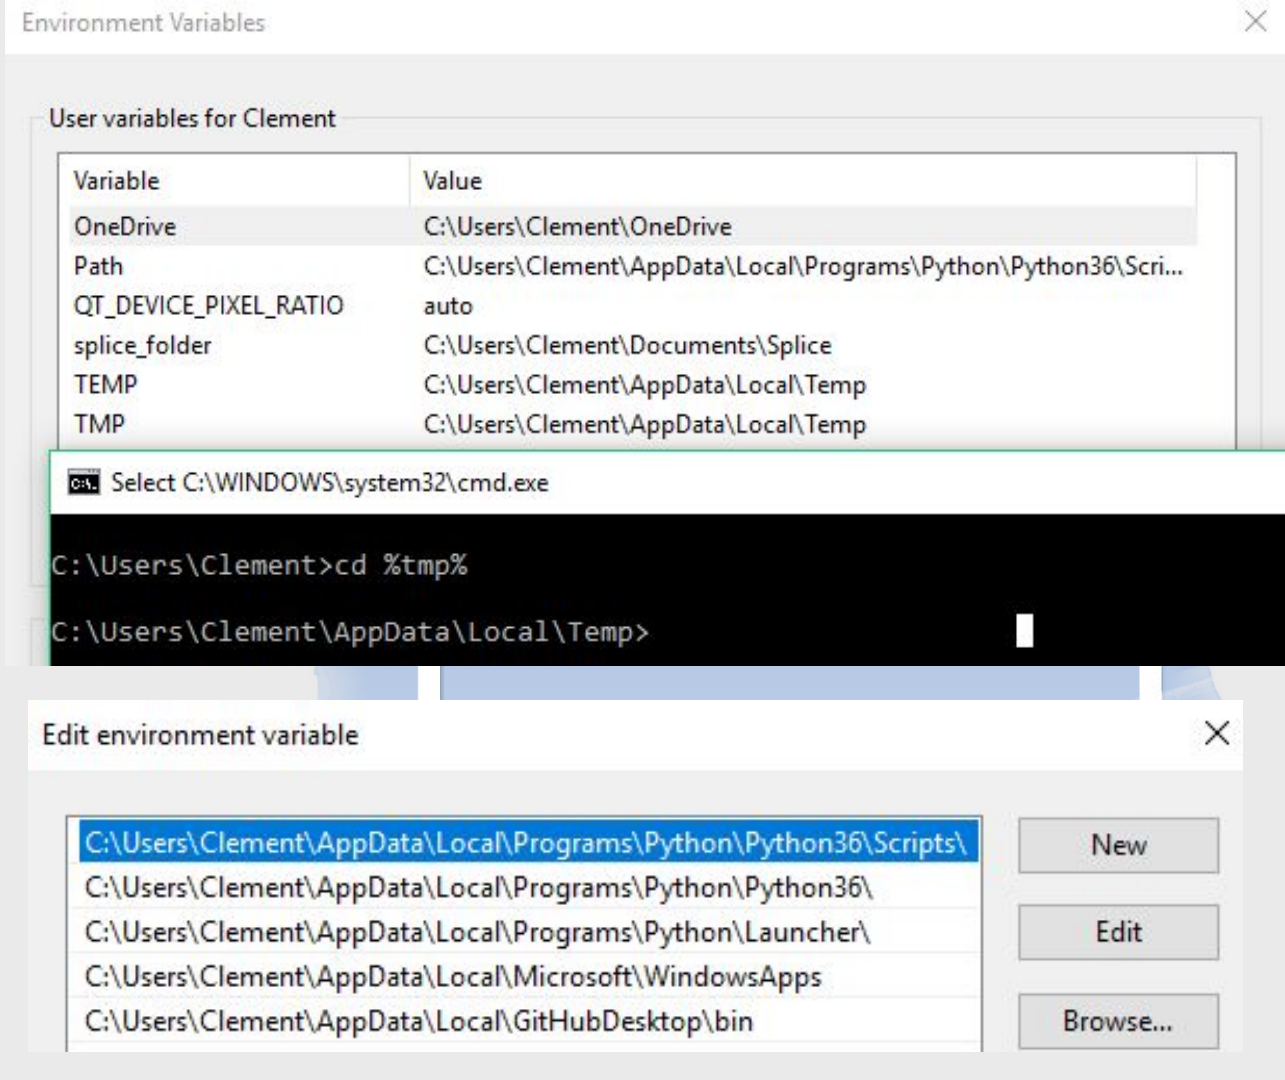

Env vars

Path is a special variable:

- Specifies directories to look for executables

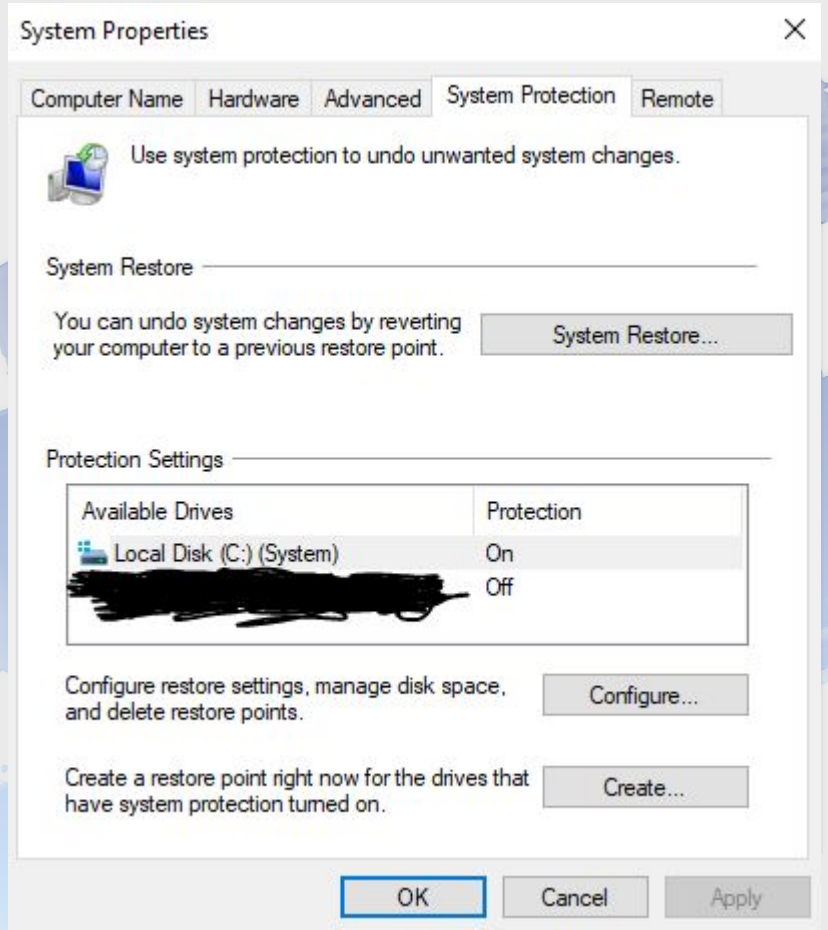

Take a look at Path above

System Protection

Set up restore point in case of failure

Important in the real world

Remote

You can also modify which users can Remote Desktop

As a review, best security practices are?

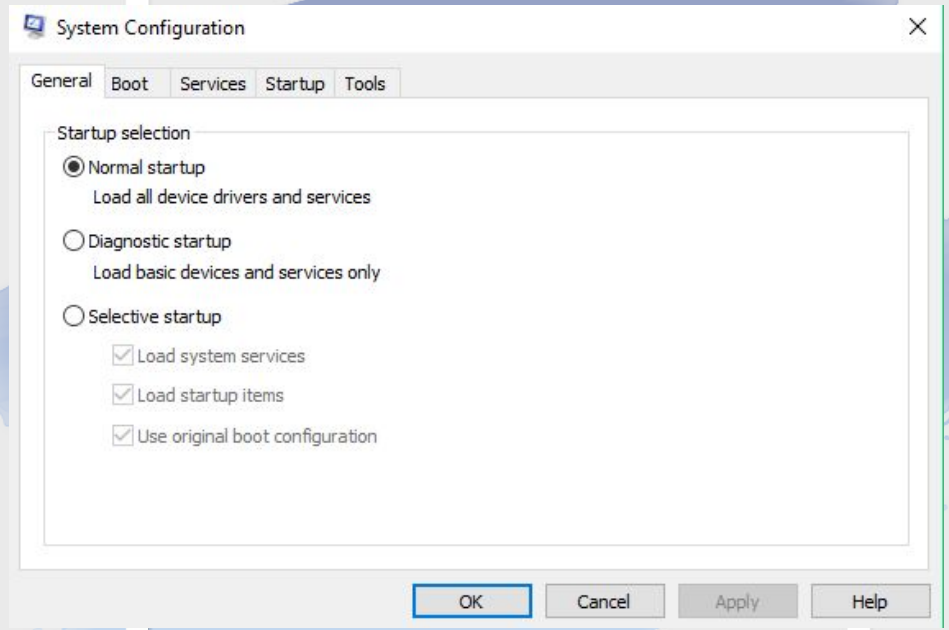

- No remote assistance
- Remote Desktop disabled

5.2 System Configuration Utility

System Conf. Utility

Run: “msconfig”

For startup configuration

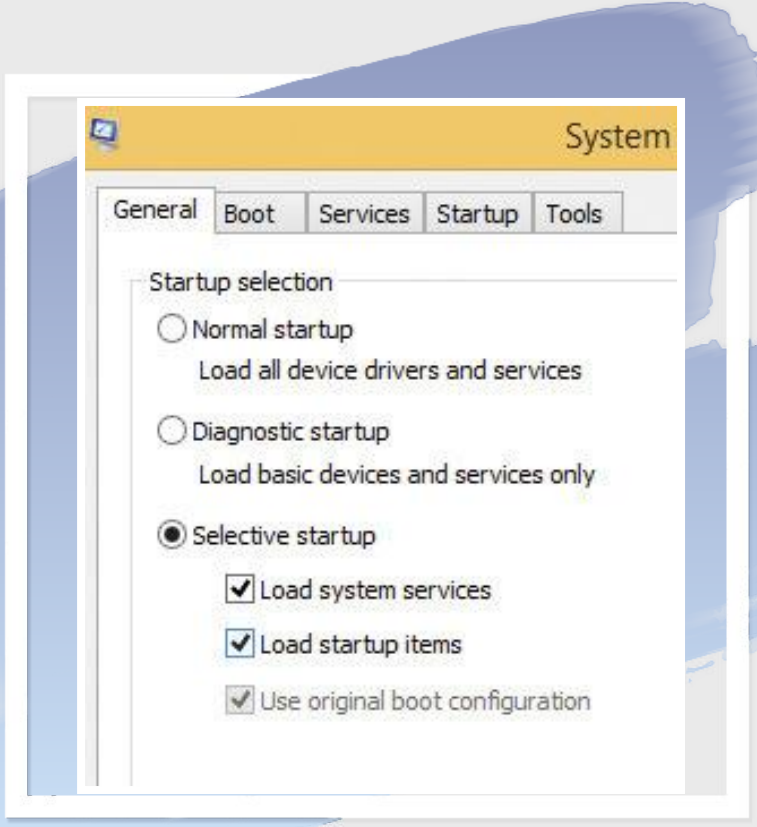

General

Choose specific startup type

- Normal
- Diagnostic
  - Only basic drivers and services start
- Selective
  - Choose what loads

Good for startup troubleshooting

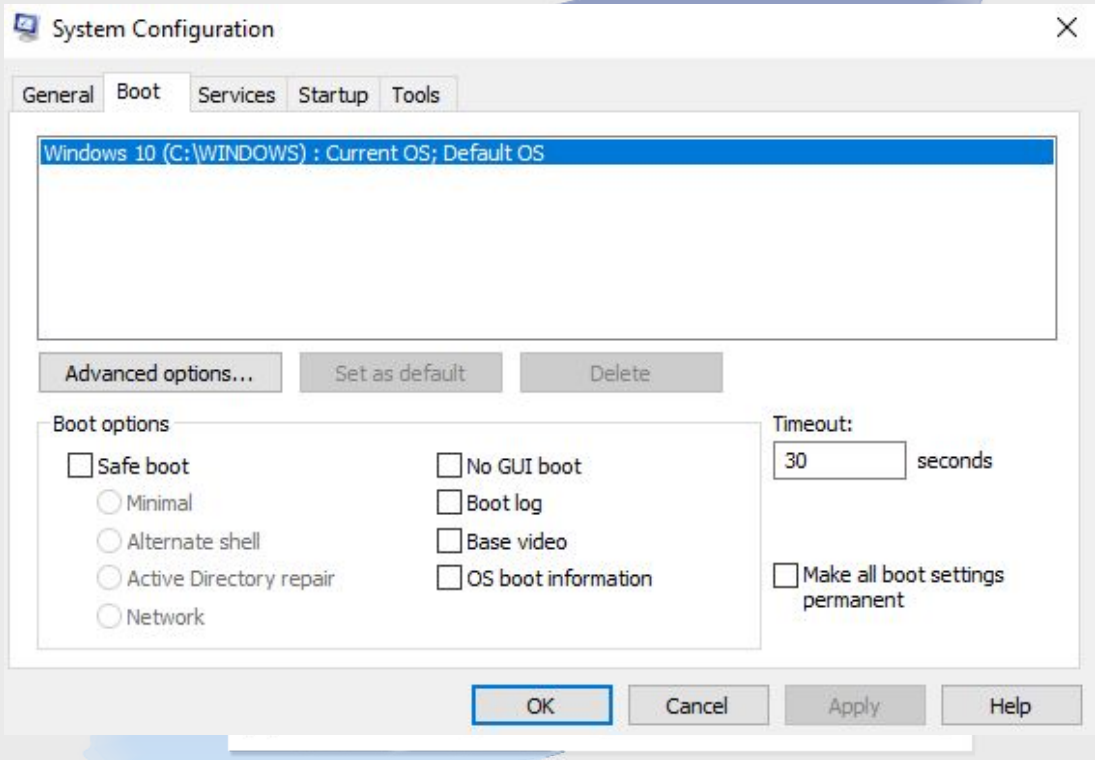

Boot

Control/modify Windows boot environment

Safe boot includes many options

Only really useful for boot troubleshooting

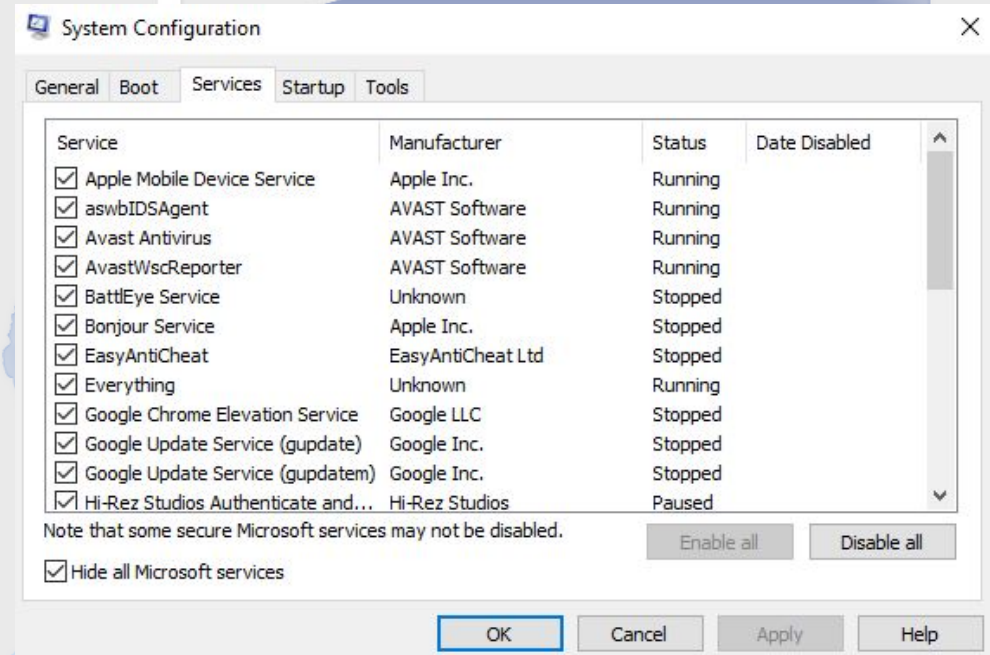

Services

Select which services are started at boot

Most useful thing is “Hide all Microsoft services”

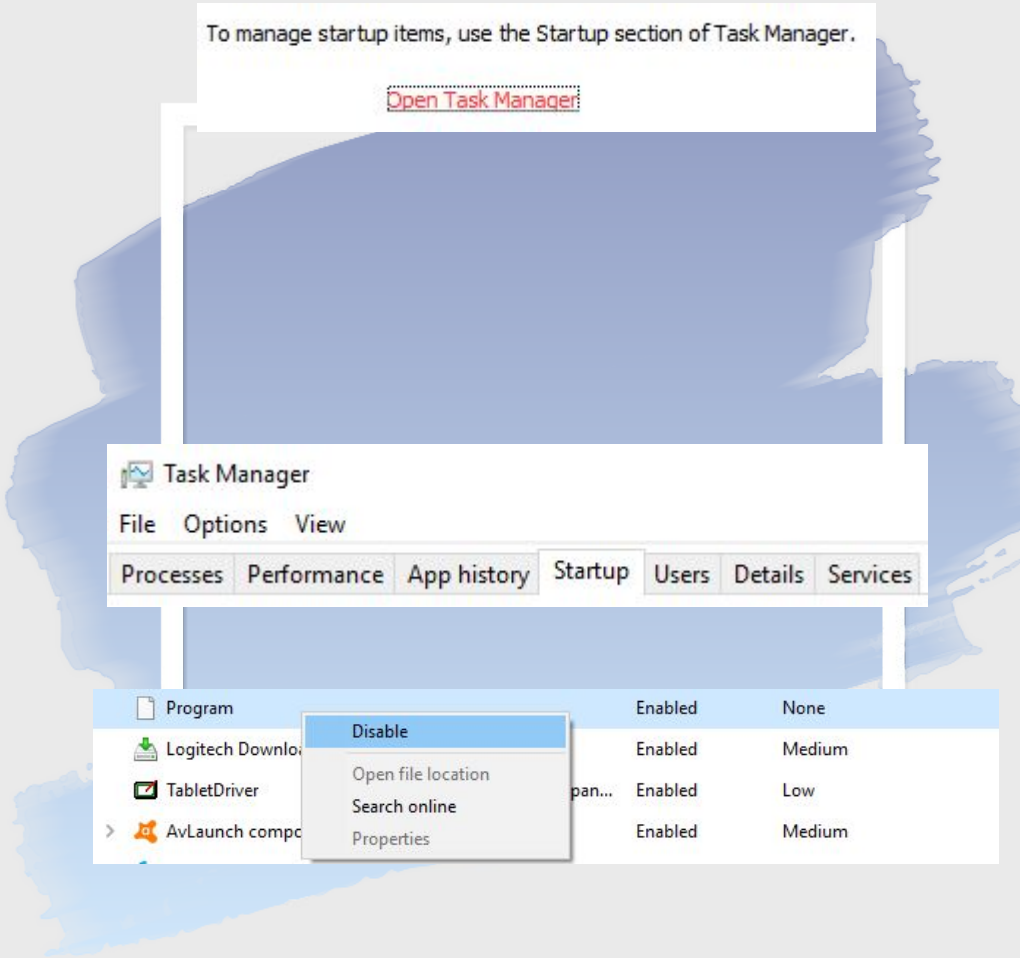

- Shows you custom services

Startup

Redirects you to Task Manager

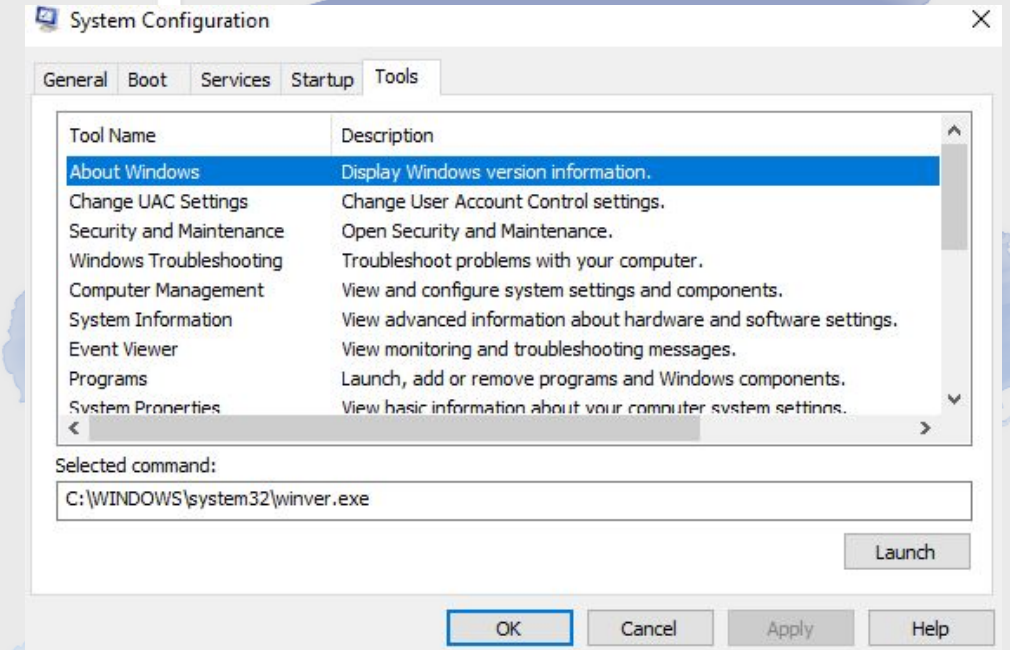

Make sure nothing bad is running at startup

Tools

Quick access to many different tools available from Windows

Not much new here, just a center point for many tools you've seen before

5.3 Monitoring Tools

Monitoring

Important in realizing on-off or repeated suspicious activity

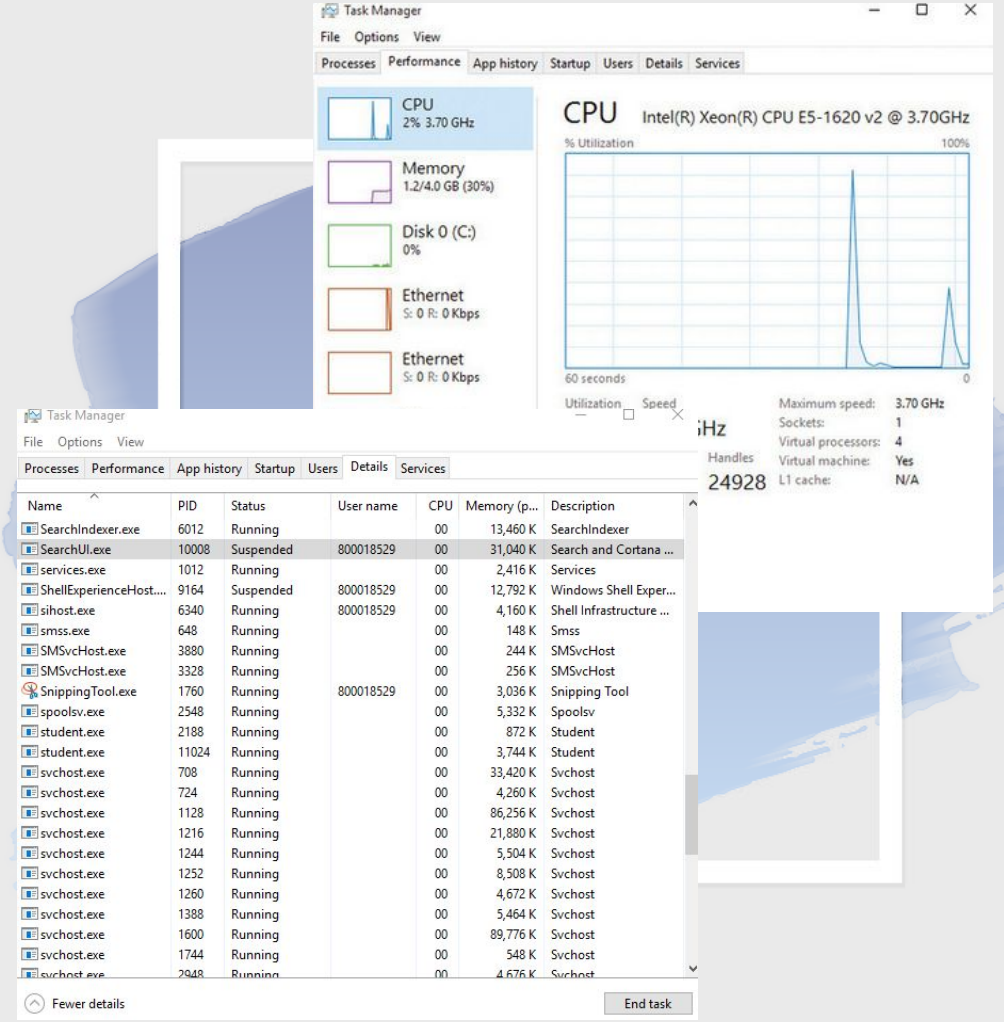

Really helpful when being attacked by hackers

Task Manager

Quick access by
right-clicking taskbar

Performance spikes can be
indicative of something

Details tab shows process
names

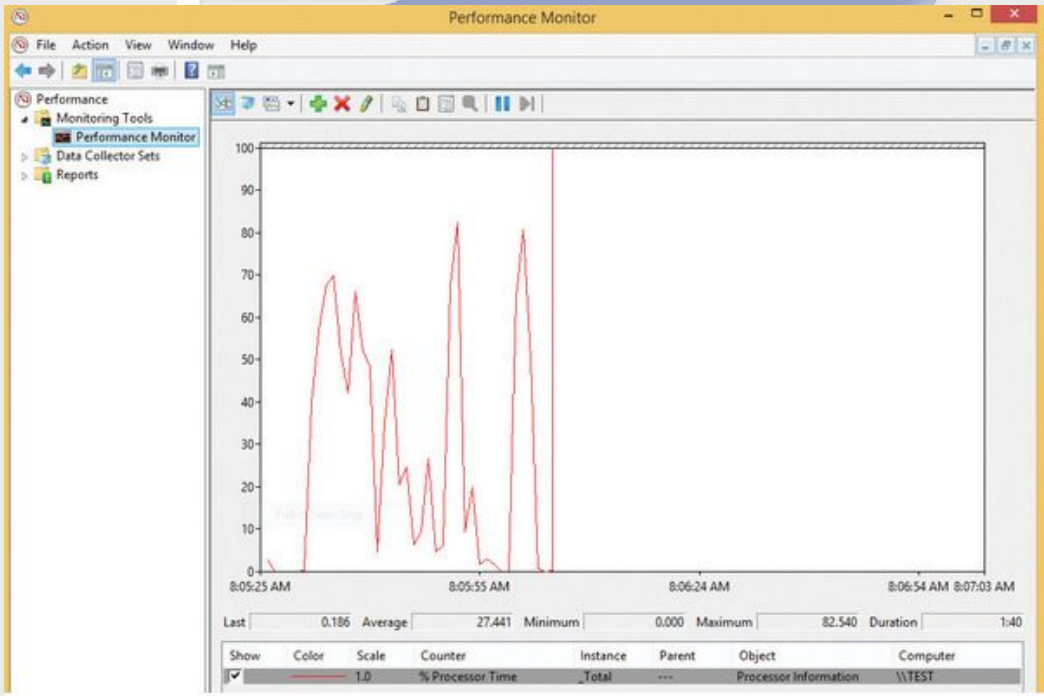

Performance Monitor

Good for specific measurements

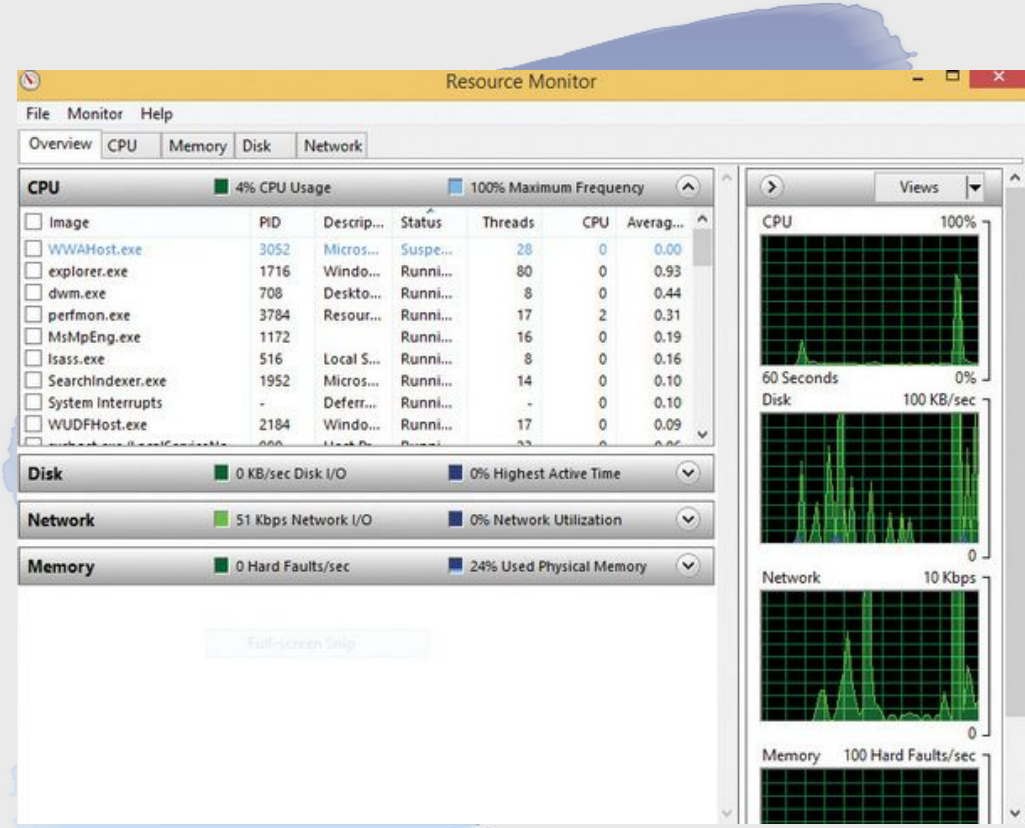

Counter - specific measurement for objects

- Counters exist for cache, memory, paging file, disk, etc.

Resource Monitor

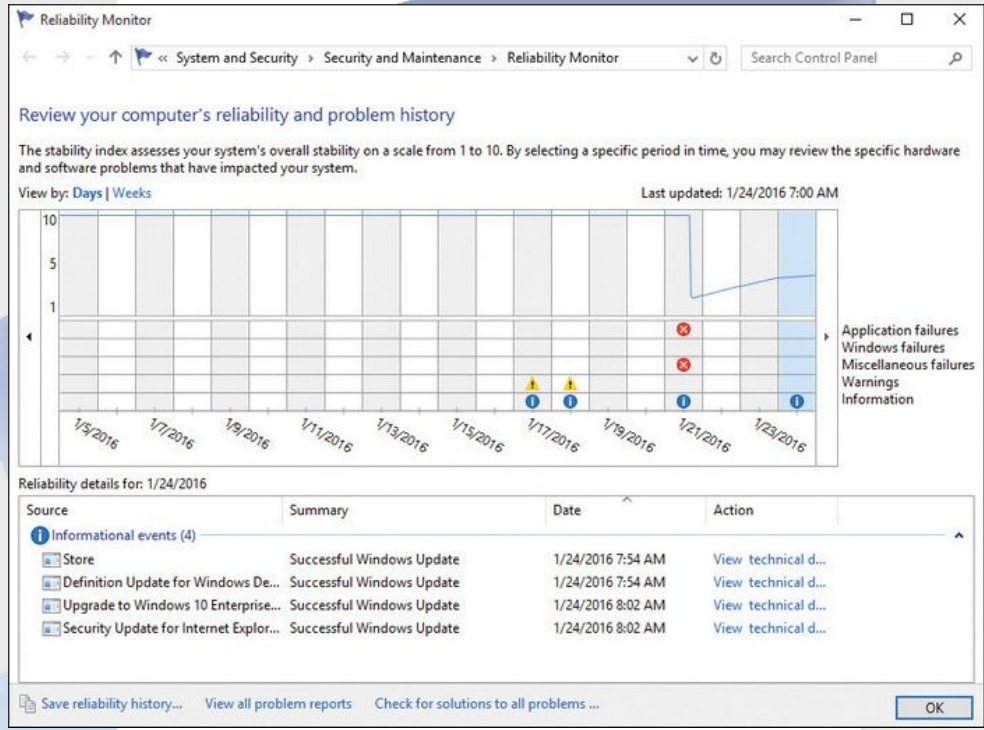

Like task manager, but splits between CPU, Disk, Network, and Memory for each process

Reliability Monitor

Most useful for servers or other critical computers that need to provide reliable service

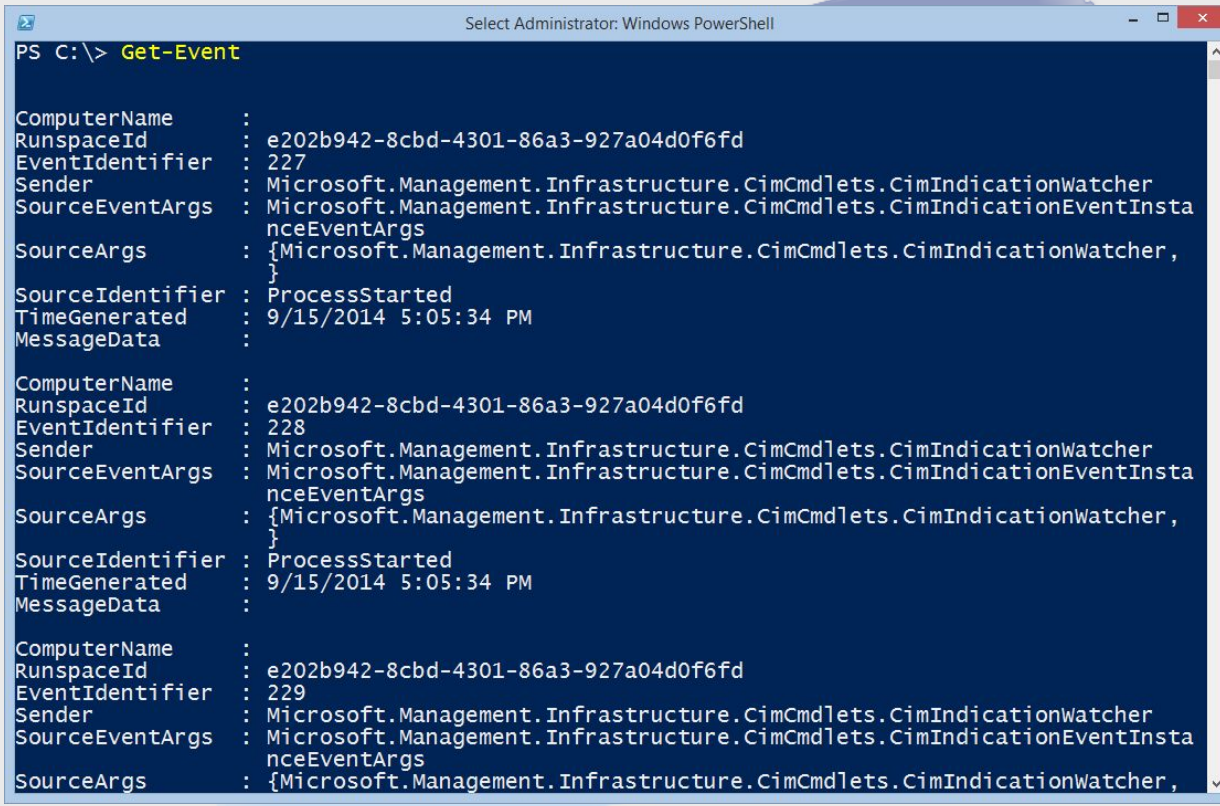

Quickly view critical reliability issues like failed updates, crashes, etc.

Customized monitoring via terminal

Use customized batch/powershell script

Can customize to show only new processes, processes in Windows dir, etc.

Summary of Monitors

- Task Manager
- Performance Monitor
- Resource Monitor
- Reliability Monitor
- Customized Terminal Monitor

Task Manager and Customized Terminal Monitor are arguably the best to use in cybersecurity

Others are more for tech stats/support

5.4 Windows Registry

Registry

The complicated heart of all Windows software and hardware

Include:

- Port configurations
- App preferences
- User profiles
  - Specific conf for each user

Loaded into RAM during boot, updates continuously

Reg Terminology

regedit - tool to edit registry

hive - branch of registry for organization

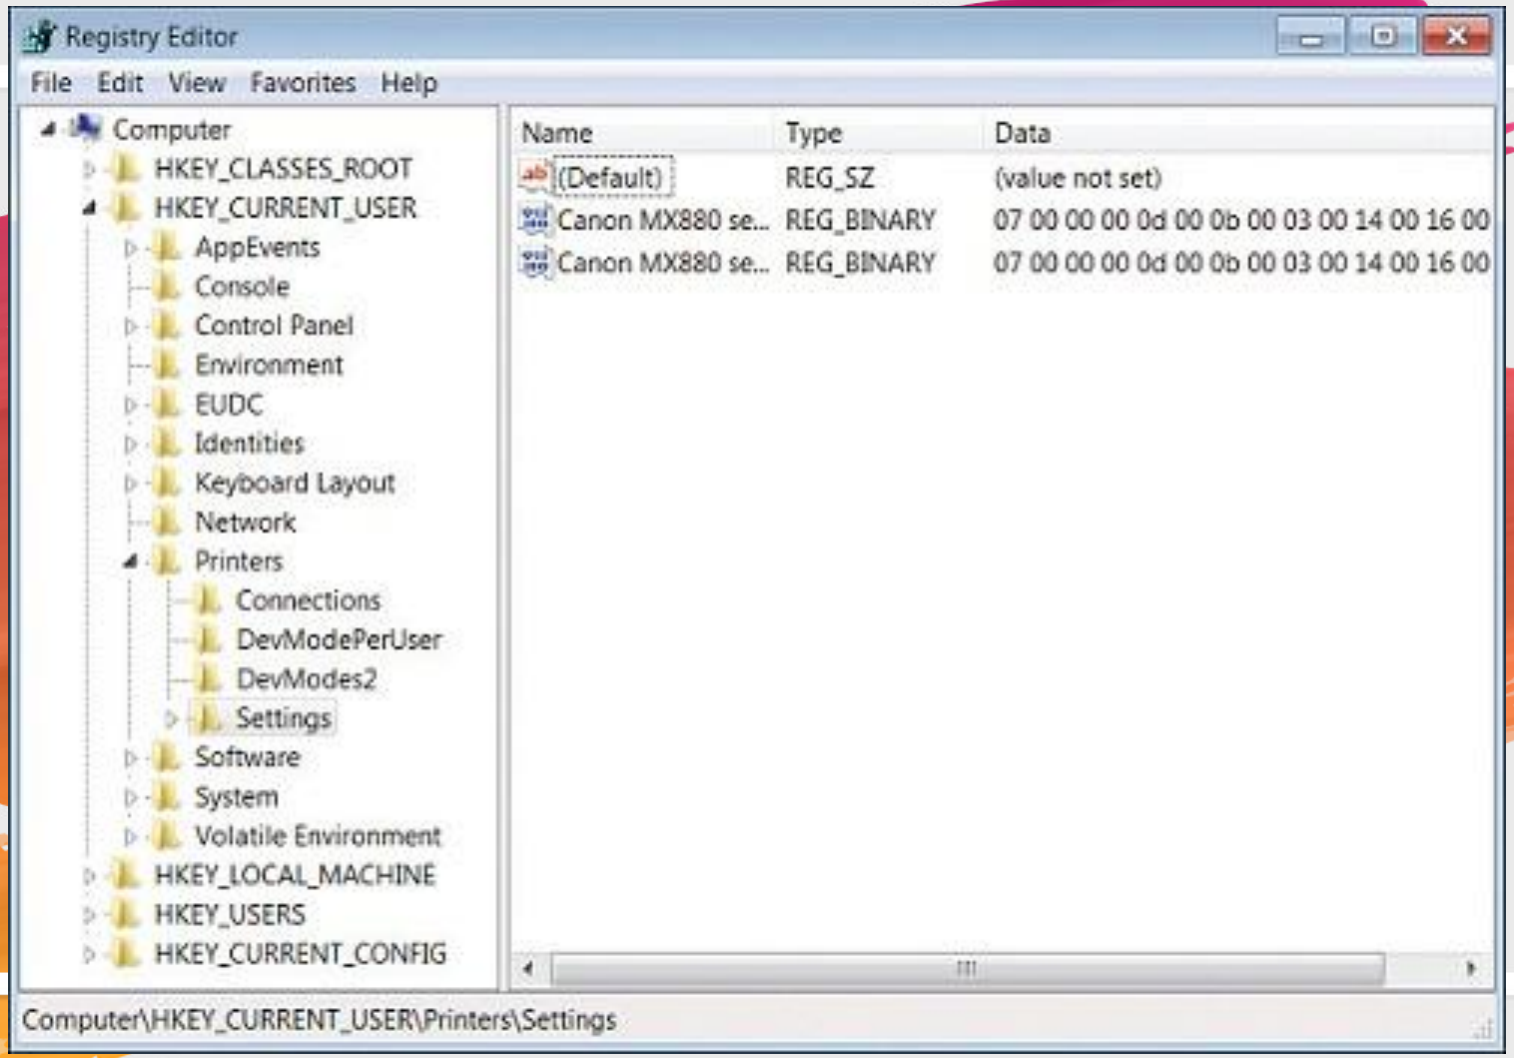

key - like a folder, contains values

value - registry setting

data - the state of a setting

type - the type of the data

can be SZ for string, BINARY, DWORD, MULTI_SZ, QWORD

Registry Editor

Computer\HKEY_CURRENT_USER\Printers\Settings

Five subtrees

All hives begin with HKEY

Registry subtree	Subtree function
HKEY_CLASSES_ROOT	• Holds file associations and file links • Allows the correct application to start when you double-click a filename
HKEY_CURRENT_USER	• User configuration, such as software settings, desktop appearance, user-created folders
HKEY_LOCAL_MACHINE	• Global hardware configuration • List of hardware components with their software drivers • Settings for each device
HKEY_USERS	• User preferences
HKEY_CURRENT_CONFIG	• Hardware profile info used on boot

Where is GPEDIT?

GPEDIT settings are split into

- Computer Configuration
- User Configuration

Corresponding subtrees are:

- LOCAL_MACHINE
- CURRENT_USER

Making changes

Relatively simple

1. Search for registry value
2. If value doesn't exist, create a new one
3. Set the data

It's a good idea to backup before changing something you don't know

File > Export

Saves as a .reg file

Why bother with registry?

Sometimes malicious settings are set in critical areas that wouldn't normally be found with GPEDIT or other tools

Typically registry searching is saved for last, as it is the most obscure

END of Part I
Any questions?
